Invention

"Irremovable Closure for Containers"

BACKGROUND

Standard tamper evident cap closures in production and currently in use, are designed to re-open after being attached onto a bottle /container. The significance of the irremovable closure invention, is once fastened onto a bottle / container the closure cannot be re-opened, detached or removed.

Its irreversible closable seal ensures it becomes integral with the container upon placement to ensure permitted use with the associated dispensing device.

“Irremovable Closure for Containers”

Sectors

Scope

The irremovable closure allows for infinite uses in many sectors using corresponding containers / bottles for product security and captive dispensing interface.

Technology

“Irremovable Closure for Containers”

- Suitable for PH Acidic / Alkaline Chemicals
 - Eliminates Transportation Leakages
 - UN Certified with Corresponding Bottles (U)
- Supports Existing Production Filling Processes
 - Single Component Piece
 - Multiple Colours

Invention

“Dispensing Container Securement”

Securing the container by way of its handle

With the majority of controlled liquid dispensing systems available, a closed, lockable cabinet is used to enclose the refill container. These type of systems do not necessarily provide security and control with convenience and simplicity. Many of these systems relinquish security with stock control and are complex to use. Containers can be readily removed and replaced by uncontrolled / unauthorised products.

The Dispensing Container System provides a universal solution to the problem addressed above. It is done by securing the dispensing container by way of its handle through the handle shaft of the dispenser housing. The universal system enables container lockout from alternative sources, as well as enabling the simple checking of fluids and simple filling thereof.

“Dispensing Container Securement”

Securing the container by way of its handle

Unlimited Dosing Pump Applications

The dispensing system housing can be easily installed with new or existing automated or manual dosing equipment from any of the leading Chemical Dispenser / Dosing Brands. A tube holder feature allows the flexible tubing from a dosing device to be hidden internally.
